Fluoride Coatings for Your Child's Teeth

Fluoride Varnishes Protect Teeth

What are they?

Fluoride varnishes are protective coatings that are painted on a child's teeth to prevent cavities.

Your dentist or dental hygienist might even paint it on teeth that already have cavities because the fluoride can stop cavities from getting bigger.

How long does it last?

The fluoride coating will work best if it is painted on the teeth 2–4 times each year.

Your dentist or dental hygienist can tell you what your child will need.

How are they put on?

The varnish will be painted on your child's teeth. There is no pain, but your child may cry because he may not like strangers putting their hands in his mouth.

There will be some yellow color on your child's teeth the first day that will go away when they are brushed.

Are they safe?

Yes! They've been used for many years and many children have had them!

What else do I need To remember?

Your child should eat only soft foods for 4–6 hours after the varnish is applied. Do not brush your child's teeth that night. Start brushing again the next morning.

Baby teeth are important!
